

Design Features

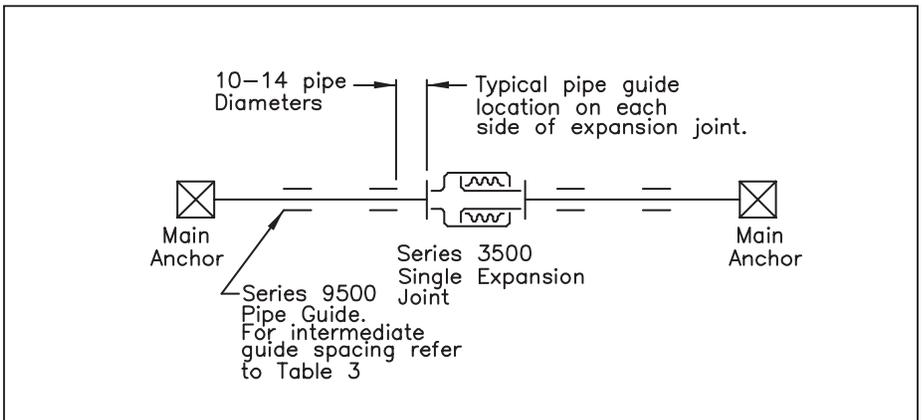

Applications

Series 3500 expansion joints are designed for installations where the principal movement is axial. Standard single configurations are designed for 4", 6" and 8" of axial compression (pipe expansion) and 1", 2" and 2" extension respectively. Dual configurations are designed for 8", 12" and 16" of axial compression and 2", 4" and 4" extension respectively. If the primary movement is extension (pipe contraction) the expansion joint can be preset at the factory. The piping system must include anchors to react the force produced by pressure thrust and the bellows spring constant, supports to react the weight of the pipe and media, and guides to ensure that the pipe alignment is maintained.

Single Expansion Joint, 3501 or 3502 Adjacent to Main Anchor

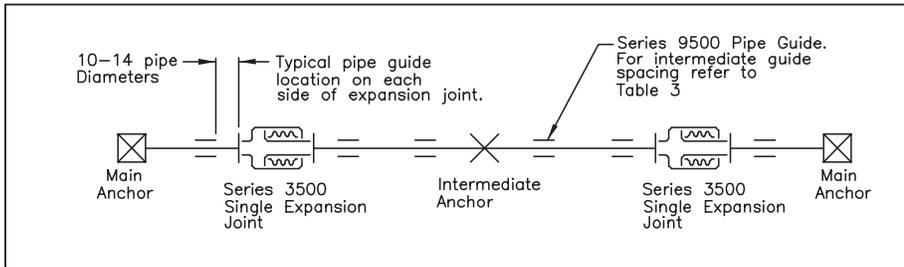

Single Expansion Joint, 3501 or 3502 Located in the Middle of a Run

Applications, Continued

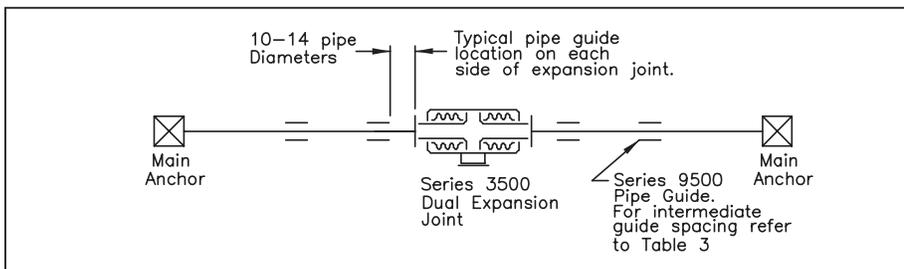

Two or More Single Expansion Joints 3501 or 3502 with Intermediate Anchors

See page 5 for calculation methods for travel required and anchor forces.

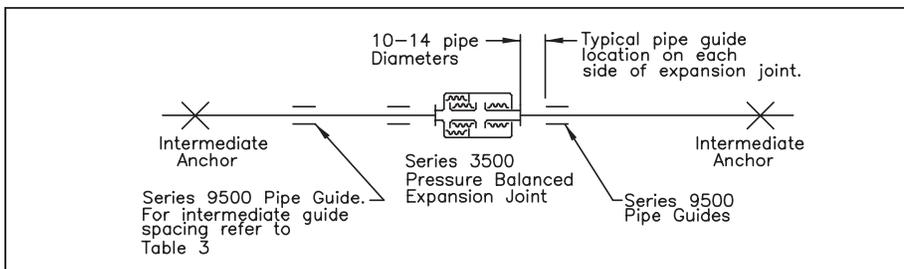

See Table 3 for minimum recommended intermediate guide spacing to ensure that the pipe travel is translated to, and aligned with the expansion joint.

Dual Anchor Base Expansion Joint 3505 or 3506 Located in the Center of a Run

Series 9500 Pipe Guide see Catalog 1004 for details.

In-Line Pressure Balanced Expansion Joint 3501PB or 3502PB with Intermediate Anchors

In-Line Seismic Expansion Joint 3500IS

Hyspan Series 3500 expansion joints are combined with Hyspan Barco ball joints to create an in-line rugged maintenance free product that can be used for seismic

connections, tank and building settling, and pipe line settling in unstable soil. Standard designs 2"-12" for 24" axial extension or compression combined

with 24" offset from centerline in any direction. Refer to catalog material for 3500IS for complete details. Horizontal or vertical installations.
